

Weekly Performance Report

CX Service Operations · Delivery LOB · Phone and Live Chat

Deliverable 2: CX Quality Analyst business case

1–31 May 2026 · W19–W22

MX · CO · CR · PE

Prepared for CX Leadership

Source	Grain: one row is...	Volume	Period	What it answers
QA audits	One audited interaction	2,460	4–29 May	QA score, attribute defects, channel
QA attribute fails	One failed attribute in an audit	518	4–29 May	Pareto of defects, critical vs non-critical
CSAT surveys	One survey answer	77,266	1–31 May	CSAT %, star rating mix, verbatim comments
Recontact	One contact-reason / channel / day	994,591	1–31 May	Recontact rate, repeat volume by reason

How we treated the data

- **N/A Logic Exclusions:** Non-applicable attributes (Value 2) are dropped from both numerator and denominator calculations.
- **Critical Zeroing Penalty:** A single Critical Attribute failure instantly drops the total audit score to 0%.
- **Rubric Independence:** Phone (12 attributes) and Live Chat (8 attributes) are evaluated using isolated frameworks; official QA ignores resolution dropdown tags.
- **True Weighted Aggregation:** CSAT and Recontact rates are computed as weighted monthly ratios rather than unweighted averages of daily metrics.
- **Statistical Cutoff:** Agents with under 5 monthly audits are filtered out of individual agent rankings to eliminate low-sample variance.

Scope & Limitations

- **LOB Restriction:** Scope is strictly limited to the **Delivery** line of business (LOB cuts collapse into Business Type).
- **Sampling Asymmetry:** Audit distribution is heavily skewed toward Live Chat (85.6%) versus Phone (14.4%), under-sampling voice channels.
- **Channel Audit Coverage:** Recontact spans 12 operational channels, whereas QA auditing only covers Live Chat and Phone.
- **Metric Cross-Analysis:** QA and CSAT correlations are calculated exclusively across the **45 shared contact reasons** present in both datasets.
- **Timeframe Alignment:** CSAT and Recontact cover the full calendar month (May 1–31), while QA audits span May 4–29 (starting W19).

May in volume	
994,591	Customer contacts
77,266	CSAT surveys
2,460	QA audits

Key Performance Takeaways & Structural Findings

- **Scorecard Divergence (2 of 3 Missed):** High QA compliance (94.14) fails to translate to customer satisfaction (79.95% CSAT vs 85.0% goal). Recontact finished over tolerance at 5.83% (vs. 5.44% limit) despite a week 4 improvement to 5.26%.
- **QA-CSAT Metric Decoupling ($R^2 = 0.023$):** Across 45 shared contact reasons, internal QA compliance shows virtually zero correlation with CSAT. Live Chat scores 96.01 QA / 77.6% CSAT, while Phone scores 83.04 QA / 86.3% CSAT. Auditor close rate (not FCR): Phone 9 of 10 assessed (87.9%), Chat 6 of 10 (63.0%). 499 of 658 unresolved chats followed process.
- **Structural Audit Blind Spots:**
- **Resolution Masking:** 527 audits followed SOPs without resolving the case, yet averaged 96.87 QA.
- **Rubric Distortion:** Chat lacks critical penalties for inaccurate information, allowing 80% of process-failing chats (297/372) to score 100. Correcting this rubric drops true Chat QA to 80.14.

Status legend

- **Green** : at or above goal.
- **Amber** : within 5 points of goal.
- **Red** : more than 5 points off goal.

QA is measured against 85. CSAT against 85%. Recontact against 5.44%, and lower is better. That 5.44% goal is on the global rate (all channels). Built on 2,460 audits, 77,266 surveys and 994,591 contacts.

Currently customers can go through either one of these scenarios when contacting us if the **policy/tools allow it** or **not**.

SCENARIO 1 – IF THE POLICY/TOOLS ALLOW IT (IDEAL SCENARIO)

SCENARIO 2 – IF THE POLICY/TOOLS DO NOT ALLOW IT (CURRENT CHALLENGE)

If policy / tools allow it

If they do not

Step 2 · QA

1,169 audits resolved + followed process · QA 95.86

527 audits not resolved + followed process · QA 96.87

Step 3 · Close

Closed 1,415 of 2,114 assessed (66.9%)

75.4% of not-resolved still followed process · 215 policy + 116 tools

Step 4 · CSAT

Wrong / damaged / inedible / incomplete order: 89–92% CSAT

Order status & delays: 64.7% CSAT despite QA 97.3

Step 5 · Recontact

Those reasons: 2.9–5.2% recontact

Order status & delays: 19.34% (7,680 repeats) · Human channels 15.56%

Internal QA audits conversational compliance; customers rate outcome resolution.

Cases that never closed score the highest on QA

Audit Breakdown & Rubric Flaws

- Resolution Masking:** 527 audits followed SOPs without resolving the issue, yet averaged a **96.87 QA score** (higher than resolved cases at 95.86).
- Unpenalized Process Fails:** Due to lenient rubrics, **80% of chats with process failures** (297 of 372) received a perfect score of 100.
- Score Recalibration Impact:** Aligning Chat evaluation criteria with Phone standards lowers true Chat QA from **96.01 to 80.14** (below the 85.0 target).

QA does not tell you if the customer will be happy

Does higher QA mean better customer outcomes?

- Inverse Correlation ($r = -0.151$):** Across 45 shared contact reasons, QA scores show a slight negative relationship with customer satisfaction.
- Negligible Predictive Value ($R^2 = 0.023$):** QA compliance accounts for only **2.3% of CSAT variance**, proving internal QA has virtually no bearing on customer sentiment.
- Resolution vs. Compliance:** CSAT tracks closure, not process. Phone closes 9 of 10 assessed (87.9%); Chat 6 of 10 (63.0%). 499 of 658 unresolved chats followed process. The rubric fix makes QA honest; CSAT moves when policy and tools let agents close.

QA score: daily individuals chart

QA: one dip on 6 May. Otherwise steady

CSAT blended: every day is stable. Every day is below goal

CSAT blended: steady. Every day below goal

Recontact: last week under 5.44%. Month still above

Recontact global: last week under goal. Month still amber

Blended CSAT remained below target throughout the month

Structural Process Deficit: All 31 days operated strictly within normal statistical control limits (LCL 76.60% – UCL 83.24%), yet 100% of daily data points failed to meet the 85.0% CSAT target. This confirms common-cause process limitation rather than isolated operational noise.

Metric Trajectory: QA maintained steady performance near 94.49% (aside from May 6 at 86.44%). Recontact trended favorably in week 4 (5.26%), but finished the month above threshold at 5.83%.

Actionability over Coaching: Because underperformance is embedded in system/policy design, agent coaching alone will not shift results. Sustainable CSAT recovery requires empowering agents with direct resolution tools (e.g., instant refund authority, real-time ETA tracking, clear escalation paths).

01

QA analysis

Score against goal by channel and by contact reason. Then the defects behind each gap.

Channel	QA	vs 85	Audits	Status
Phone	83.04	-1.96	355	Near goal
Live Chat	96.01	+11.01	2,105	On goal

Key Phone Performance Factors

- Higher Case Complexity:** Phone tends to absorb high-friction scenarios, including refund requests, billing disputes, and undelivered orders.
- Higher Critical Defect Rate:** Phone exhibits a **13.52% critical failure rate**—more than 4.5x higher than Live Chat (2.95%).
- Sample Weighting Bias:** Phone accounts for only **14.4% of total audits** (355 evaluations), muting its impact on the blended operational QA score.

QA-CSAT Relation: High Chat Volume & Lenient Rubrics Mask Operational Risks

- Phone QA sits below target at 83.04 (-1.96 pts), while Chat reaches 96.01. Chat is 85.6% of audits, so it inflates blended QA to 94.14. Chat's score reflects a lenient form (no critical for information accuracy). Recalibrating Chat to Phone rules drops it to 80.14. Among assessed contacts (not FCR), Phone still closes 9 of 10 (87.9%) and Chat 6 of 10 (63.0%). Phone CSAT 86.3% vs Chat 77.6%. The greener QA score is the weaker closer.

Defect Breakdown

- Primary Volume Driver: Time Management is 64.3% of Phone fails (133). This month: system-check script at the start of money and undelivered calls; escalate if no data in 2 minutes.
- Disproportionate Score Drag: Complete & Correct Information is 28 fails and -6.55 pp (critical). This month: 1-page job aid for undelivered/refund CRs; coach the agents on those 28 audits.
- Concentrated Root Causes: Together 77.8% of Phone defects. Month 1 Phone work is these two attributes only.

Contact reasons with the lowest QA

Contact reason (CR Lv4)	QA	n	Status
Completed but not received — market place	47.5	4	Off goal
Active order, already received	65.8	12	Off goal
Paying the courier	66.7	3	Off goal
Completed but not received — full service	68.2	49	Off goal
Courier overcharged me	68.6	7	Off goal

Root Causes Behind Low QA Drivers

- High-Friction Use Cases:** Low-scoring contacts concentrate in complex financial and delivery disputes (e.g., undelivered orders, courier fees) that require external tool verification.
- System-Induced Delays:** Dependency on backend tools prolongs call duration, directly inflating *Time Management* defect rates.
- Critical Failure Severity:** Inaccurate guidance or incomplete policy execution during complex disputes triggers automatic zero-score audits.
- Resolution Bottleneck:** Phone still closes 9 of 10 assessed contacts (87.9%; abandon 4.8%). The 1 that does not close is mostly undelivered or refund; 28 of 41 unresolved followed process.

Live Chat: greeting leads. ★ = critical (correct info is not scored)

Defect Breakdown

- Soft Skill Bias: Greeting (30.9%) and Service Attitude (22.2%) are 53.1% of Chat defects. This month: mandatory open-chat greeting/ID macro, and next-step macros on stuck CRs.
- Highest Score Drag: Service Availability is 46 fails and -2.10 pp (critical). This month: WFM/Chat Ops on queue, wrap-up, and not leaving the chat hanging.
- Rubric Blind Spot: The form still does not score information accuracy. That is a measurement change, separate from this month's defect correction.

Contact reasons with the lowest QA

Contact reason (CR Lv4)	QA	n	Status
verbal aggression	76.0	5	Off goal
referral coupon information	80.0	5	Near goal
store registration	80.0	5	Near goal
cancel the order	86.7	9	On goal
modify payment method	86.7	9	On goal

Root Cause & Score Distortion o Structural Rubric Gap

- Channel Disparity:** Unlike Phone evaluations, Live Chat does not categorize *Information Accuracy & Completeness* as a critical failure.
- Artificial Score Inflation:** 80% of chats with process failures (297 out of 372) currently receive a perfect score of 100.
- Recalibrated Score Impact:** Chat closes 6 of 10 assessed (63.0%; abandon 15.6%). 499 of 658 unresolved chats followed process. Recalibrating the form drops QA to **80.14; it does not close those cases.**

"Consolidated cross-channel view evaluating 20 QA attributes (12 Phone, 8 Chat)."

Defect Concentration Analysis

- **Defect Concentration (80/20):** Just 7 attributes account for **82.8%** of total audit failures (518 fails across both channels).
- **Critical Failures (★):** Critical attributes carry maximum risk as single failure triggers an automatic zero score for the entire audit.
- **Volume vs. Severity Trade-off:** Time Management is the highest Phone volume fail; Complete & Correct Information is the highest Phone score drag. Month 1: those two plus Chat greeting, attitude, and availability.

QA score distribution: most audits sit at 0 or 100

Score Distribution & Scale Behavior

- **Polarized Results:** **82.7%** of evaluated contacts achieve a perfect score (100), while **4.5%** score a complete zero due to critical failures.
- **Binary Scale Behavior:** Only **12.8%** of audits fall in the mid-range (70–90 pts), causing the QA evaluation to behave more as a **binary pass/fail indicator** than a continuous diagnostic metric.

QA analysis: where we concentrate this month

Correct the defects we already score. Chat information accuracy is a scoring change, separate from this list.

Defect	Channel	How we correct it	Who	When
Time management (133 fails, 64.3%)	Phone	System-check script at the start of money and undelivered calls. Escalate if no data in 2 minutes.	Supervisors	27 Jun
Complete and correct information (28 fails, -6.55 pp)	Phone	1-page job aid for undelivered and refund CRs. Coach the agents on those 28 audits.	QA Lead + Supervisors	27 Jun
Greeting and identification (96 fails, 30.9%)	Live Chat	Mandatory open-chat greeting and identification macro.	Chat Ops + QA Lead	13 Jun
Service attitude (69 fails, 22.2%)	Live Chat	Next-step macros on stuck CRs. Recalibrate attitude when the case cannot close.	Chat Ops + QA Lead	27 Jun
Service availability (46 fails, -2.10 pp)	Live Chat	WFM and Chat Ops on queue, wrap-up, and chats left hanging. This is the Chat critical we already score.	WFM + Chat Ops	13 Jun

This is defect correction, not a scoring change

These five attributes are already on the form. Adding Chat correct-information as a critical is a separate scorecard change (Chat QA would read 80.14). It does not lift CSAT. Cases that followed process and still did not close belong to process, not to the agent.

Blended ranking (Phone + Chat together). Official QA never mixes the two lists. At least 3 audits.

Lowest QA reasons (blended)			
Contact reason	QA	n	Status
Completed but not received — market p...	58.0	5	Off goal
Referral coupon information	66.7	6	Off goal
store registration	80.0	5	Near goal
verbal aggression	82.5	8	Near goal
Completed but not received — full ser...	86.5	138	On goal

Drivers of Channel Metric Divergence

- Blended vs. Isolated Governance:** Blended views create false positives; operational decisions require channel-isolated audits.
- Channel Performance Variance:** "Verbal aggression" averages 82.5, but isolating channels reveals a critical deficit in Chat (76.0, N=5) versus Phone (93.3, N=3).
- Volume-Driven Masking:** "Undelivered full-service" appears compliant at 86.5 (N=138), hiding a failing 68.2 Phone baseline (N=49).
- Operational Risk:** Relying solely on blended averages allows critically failing voice queues ("red") to masquerade as compliant ("green").

Aggregation Risk: High Chat Volume Masks Critical Voice Failures

Channel Masking Effect: Blending channels conceals critical voice underperformance. For example, "Completed but not received — full service" scores a failing 68.2 QA on Phone (N=49). When blended with high-volume Chat, the score artificially rises to 86.5 QA (N=138) diluting severity without fixing the root cause in Phone.

02

CSAT and voice of the customer

Blended CSAT against goal. Then Phone vs Chat. Who is dragging it. What detractors say.

Channel	CSAT	Surveys	vs 85	Status
Phone	86.3%	21,304	+1.26 pp	On goal
Live Chat	77.6%	55,962	-7.45 pp	Off goal
Blended (official)	79.95%	77,266	-5.05 pp	Off goal

Phone vs Chat vs blended

- Channel Volume Drag:** Live Chat dominates customer sentiment with **72.4% of total surveys (55,962)**. Its failing score of **77.6% (-7.45 pp vs. goal)** completely drags down Phone's passing performance of **86.3% (+1.26 pp vs. goal)** to a blended **80.0%**.

Contact reason (CR Lv4)	Blended	Phone	Chat	Surveys
Order status / delay inform...	67.8%	80.3%	62.8%	9,918
Disagrees with cancellation...	67.4%	77.6%	63.6%	5,992
order status & delays	64.7%	79.8%	60.3%	5,096
No longer wants the order	88.3%	94.2%	81.9%	10,518
refund status and conditions	67.0%	78.7%	57.0%	3,582

Contact reasons dragging CSAT down (blended)

Systemic Chat Vulnerability in High-Friction Cases: Across all bottom-performing contact reasons, Phone outperforms Live Chat by **12.3 to 21.7 percentage points**:

- Refund Status & Conditions:** Chat collapses to **57.0% CSAT** vs. Phone's **78.7%** (a **21.7 pp gap**).
- Order Status & Delays:** Chat drops to **60.3% CSAT** vs. Phone's **79.8%** (a **19.5 pp gap**).
- Order Status / Delay Info:** Chat records **62.8% CSAT** vs. Phone's **80.3%** (a **17.5 pp gap** across 9,918 surveys).

Most ratings are 1 star or 5 stars (blended Phone + Chat)

Customer Sentiment

Bimodal Rating Polarization: Customer perception follows an "all-or-nothing" distribution: **92.2% of ratings are binary extremes** (75.7% 5-star vs. 16.5% 1-star). Neutral/mid-tier ratings (2–4 stars) represent only 7.8%, proving customers evaluate contacts as total success or complete failure.

CSAT by Business Type (blended): every line of business is below goal

Line of Business

Uniform LOB Deficit: Underperformance is consistent across all business lines (79.7%–80.7%), with **Food generating 59.6% of total survey volume (46,071)** at 80.7% CSAT.

What detractors complain about

Detractor Driver Disconnect: Resolution vs. Soft Skills

- **Resolution Deficit Dominates (35.4%):** Missing refunds (18.8%) and lack of solution (16.6%) drive over a third of all negative verbatim feedback.
- **Soft Skills Over-Weighting (4.3%):** "Agent attitude" accounts for only 4.3% of detractor complaints (171 comments), despite being heavily weighted in traditional QA rubrics.
- **Operational Takeaway:** Customers evaluate experience based on functional problem-solving, not conversational politeness.

Dissatisfaction Ownership Breakdown

Owner the auditor tagged	Cases	Share
CX Process	54	49.5%
People (CSR)	24	22.0%
End User	11	10.1%
External Factors	10	9.2%

Does higher QA mean better customer outcomes?

- **CSAT Correlation ($r = -0.151$, $R^2 = 0.023$):** QA scores explain only 2.3% of CSAT variance across 45 contact reasons.
- **Recontact Correlation ($r = -0.078$):** QA compliance shows a slightly negative correlation with recontact reduction.
- **Strategic Conclusion:** Optimizing for current QA metrics will not shift CSAT or lower repeat contacts, as standard audits measure compliance rather than the process resolution required by customers.

03

Recontact analysis

Rate against goal. Which channels and contact reasons drive repeat contacts.

5.83% is global (all 12 channels) vs 5.44% goal · Human channels (Phone + Chat): 15.56%

Automation Masking Effect: Self-Help Disguises Human Channel Deficit

- Metric Masking:** Massive Self-Help volume (666.6k contacts / 67.0% share) maintains a low 1.22% recontact rate, artificially keeping global business reporting at 5.83% (near the 5.44% target).
- Assisted Channel Deficit:** Removing Self-Help exposes an assisted recontact rate of 15.19%, peaking at 15.56% for human channels (Phone + Live Chat)—nearly 3x the maximum operational tolerance (5.44%).
- Volume Driver:** Live Chat single-handedly generates 67.2% of all repeat contacts in the business (38,961 repeat cases).

Rate by channel: where customers contact us again

Channel	Contacts	Repeats	Rate	Share of repeats
Live Chat	243,626	38,961	15.99%	67.2%
Self Help	666,650	8,154	1.22%	14.1%
Phone	49,674	6,690	13.47%	11.5%
GPTBot	19,508	2,679	13.73%	4.6%
Help Center	12,224	941	7.70%	1.6%

Dual-Metric Governance: Reporting vs. Operational Performance

- **Volume Skewing:** Self-Service absorbs 67.0% of total volume with a 1.22% recontact rate, masking operational friction in human channels.
- **1-in-6 Recontact Ratio:** Human-assisted channels operate at 15.56% recontact, meaning 1 out of every 6 customers contacting an agent requires a repeat interaction.
- **Digital Channel Friction:** Live Chat (15.99%) and GPTBot (13.73%) exhibit higher recontact rates than Phone (13.47%), proving digital channels are the main source of repeat contact.

Repeats: 3 contact reasons drive 47% of all come-backs

Where the volume sits

- Single Point Volumetric Driver: "Order status / delay information" generates **13,014** repeat cases alone (22.4% of total repeats) across 76,911 interactions.
- Top 3 Concentration (47.0%): Combined with "Order status & delays" (7,680) and "Disagrees with cancellation charge" (6,595), just 3 reasons account for **27,289** repeat contacts.
- 80/20 Rule Validation: Expanding the scope to **6 contact reasons** accounts for **81.0% of total recontact volume**, defining the exact operational scope needed to restore FCR (First Contact Resolution).

Highest recontact rates

Contact reason	Contacts	Repeats	Rate	Status
After-sales fraud review	3,146	895	28.45%	Off goal
Cash order blocked (ant...	7,278	1,776	24.40%	Off goal
order status & delays	39,706	7,680	19.34%	Off goal
Order status / delay in...	76,911	13,014	16.92%	Off goal
refund status and condi...	18,484	2,901	15.69%	Off goal

Rate = repeats ÷ contacts of that reason. More repeats ≠ higher rate.

How this compares with QA and CSAT

- Phantom Compliance (93%–98% QA):** High-recontact reasons consistently achieve near-perfect QA scores (93%–98%), proving that QA rubrics reward procedural compliance while ignoring customer resolution gaps.
- CSAT Collapse Alignment:** High recontact directly mirrors severe CSAT failure—notably in "Order Status" (64.7% CSAT) and "Refund Status" (67.0% CSAT).
- Strategic Diagnostic:** High QA scores mask unresolved customer friction. When an agent follows process without delivering immediate resolution or clear timelines, customer dissatisfaction and repeat contact remain inevitable.

04

People: where coaching should focus

Which agents sit outside the pack. Which teams carry the coaching load.

High-Liability Outliers: Priority Coaching Matrix				
Agent	QA	Audits	Team	Coaching priority
Agent 228	36.0	5	S13	245
Agent 21	61.7	6	S9	140
Agent 135	66.7	6	S12	110
Agent 44	71.4	7	S7	95
Agent 171	80.0	17	S20	85

Coaching Priority Formula: (Target 85 – QA Scor) x Audits. Prioritizes high-volume operational liability

Targeted Coaching Allocation

- High-Concentration QA Liability:** 26 agents fail the 85.0 QA goal. Concentrating coaching on the **top 5 outliers resolves 55% of total floor coaching liability** (led by Agent 228 with a priority score of 245).
- Cohort Disconnect (QA vs. CSAT):** QA Q4 (42 agents, 82.4 avg) and CSAT Q4 (76 agents, 64.4% avg) comprise mostly different individuals, proving compliance coaching will not automatically solve customer dissatisfaction.
- Tenure Degradation Risk (>1 Year Tenure):** Agents with **>1 year tenure represent the worst-performing cohort across both metrics**—registering the only group below QA target (**83.97**) and the lowest CSAT average (**74.1%**), signaling procedural drift or burnout.

Metric Ceiling Compression: QA Homogeneity vs. CSAT Dispersion

- Score Ceiling Saturation (88% Ceiling):** 75% of the agent floor (Q1–Q3) scores between **94.9 and 99.9 on QA**, driven by rubric leniency where **88% of Chat audits hit the maximum score (100)**.
- Severe CSAT Dispersion (27.1% – 96.9%):** While QA appears uniformly compliant, CSAT exposes massive execution gaps. Only Q1 (89.3%) meets the 85.0% CSAT goal; **Q2, Q3, and Q4 all fail the target (64.4%–82.1%)**.
- Diagnostic Invalidation:** QA fails as a performance discriminator. Ranking agents by QA masks real underperformance that CSAT clearly isolates.

Supervisor team matrix (31 supervisors / 20+ audits threshold): Compliance vs. CSAT execution disconnect and localized team risk.

Single-Agent Systemic Risk: Critical QA Audit Blindspot (Agent 212)

- Outlier Impact (2.7% Floor Dissatisfaction):** Agent 212 recorded a **27.1% CSAT across 564 surveys**, accumulating **411 detractor customers**. This single individual accounts for **2.7% of all dissatisfied customers in the entire monthly operation**.
- QA Audit Failure:** Standard QA sampling failed to flag this agent a single time, proving current QA audit selection mechanisms are completely disconnected from customer sentiment.

Supervisor Quadrant Analysis & Structural Team Clustering

Team	Below QA 85	Audits	Worst QA	Coaching priority
S13	3	22	36.0	280
S9	3	16	61.7	220
S20	2	28	79.1	150
S7	4	23	71.4	145
S12	2	12	66.7	120

What the team view shows

- **Asymmetric Pass Rate (15 vs. 1):** 15 out of 16 qualified supervisor teams pass the 85.0 QA threshold, yet only 1 team (S10) achieves the 85.0% CSAT target.
- **High QA / Worst CSAT Friction (Team S11):** Supervisor 11 passes QA with a **90.7 score**, yet generates the **worst CSAT on the floor at 71.0% across 4,243 surveys**, proving team-level compliance management does not translate to customer satisfaction.
- **Concentrated Team Liability:** 5 supervisor teams account for 14 of the 26 underperforming agents (53.8%). Supervisor 7 has **43% of its ranked agents in Q4**, indicating structural leadership/coaching failures rather than isolated agent error.

05

Combined analysis and root cause

Where QA, CSAT and recontact miss on the same contact reason. Then why.

Contact reason (CR Lv4)	QA	Audits	CSAT	Recontact	Repeat volume	Surveys	Pattern	Priority
Order status / delay information	95.6	25	67.8%	16.92%	13,014	9,918	Low CSAT + High Recontact	● Act this quarter
order status & delays	97.3	45	64.7%	19.34%	7,680	5,096	Low CSAT + High Recontact	● Act this quarter
Disagrees with cancellation charge	91.4	59	67.4%	12.96%	6,599	5,992	Low CSAT + High Recontact	● Act this quarter
Refund status and conditions	90.6	70	67.0%	15.69%	2,901	3,582	Low CSAT + High Recontact	● Act this quarter
Cash order blocked (antifraud)	93.6	58	n/a	24.40%	1,776	n/a	High Recontact	● Monitor
After-sales fraud review	97.4	118	6.1%	28.45%	895	475	Low CSAT + High Recontact	● Monitor

QA and CSAT columns are blended Phone + Chat. Refund status QA 90.6 is n=70 (Phone 76.4 n=25 + Chat 98.4 n=45); same contact reason, two casings in the source. Official overall QA still keeps the two attribute lists unmixed.

The same pattern is visible in a single contact reason

- Metric Disconnect:** Generates **97.3 in QA compliance** while dropping to **64.7% CSAT** and driving a **19.34% recontact rate** (7,680 repeat cases in a single month).
- Operational Bottleneck:** Agents follow guidelines flawlessly, but lack system visibility to view or adjust courier ETAs. The interaction is fully compliant for QA, yet unresolved for the customer.

Auditor Ownership Tagging

- **Root-Cause Attribution (2.2:1 Ratio):** Auditors attribute **49.5% of dissatisfaction directly to CX Process constraints**, compared to just **22.0% caused by agent execution error**.
- **Policy-Driven Failures:** **42.2% of cases** are categorized as "not resolution-based," reflecting rigid policies that prevent agents from resolving customer issues on first contact.
- **QA Score Ceiling Masking:** Process failures are artificially understated at 17.0% because **88% of Chat QA audits hit the score ceiling (100)**, masking underlying systemic friction.

- **Strong Resolution Correlation ($r = +0.80$, $R^2 = 0.64$):** Case closure rate explains 64% of an CSAT variance across 99 contact reasons, proving that a customer's outcome is the single greatest determinant of satisfaction.
-
- **QA Predictivity Failure ($R^2 = 0.023$):** Traditional QA compliance explains less than 2.3% of CSAT variance, demonstrating that agent politeness or script adherence cannot salvage an unfulfilled resolution.
-
- **Strategic Pivot:** Judge channels on close rate, not QA. Phone closes 9 of 10 assessed; Chat 6 of 10. Do not coach Chat volume for a gap that is 499 process-followed non-closes.

Reasons with lower closure rates

Contact reason (Lv4)	Resolved	CSAT	Audits	Surveys
After-sales fraud review	38%	6.1%	115	475
Delivery fee	22%	19.0%	9	21
Paying the courier	45%	30.2%	29	96
Modify the order	25%	34.6%	12	52

Reasons with higher closure rates

Contact reason (Lv4)	Resolved	CSAT	Audits	Surveys
Wrong order	90%	92.2%	40	7,359
Damaged order	83%	92.1%	47	5,962
Inedible order	87%	91.3%	190	7,685
Incomplete order	86%	89.4%	171	8,227

Contact reason → its sub-reasons

Orange box = the contact reason (Level 4). Gray boxes = its sub-reasons.

● CSAT ≥ 85 / Res ≥ 70 ● CSAT 80–85 / Res 50–70 ● CSAT < 80 / Res < 50

After-sales fraud CSAT 6.1% is 29 satisfied / 475 surveys (432 ones). One exception remains: "Return status and conditions" has a 76% closure rate but only 67.0% CSAT on 3,582 surveys, showing that closure alone does not explain every customer outcome.

Root-cause '5-Whys' auditor diagnostic (2,114 audited cases): Structural policy & tooling barriers in unclosed cases vs. tangible resolution drivers in closed cases.

Structural Non-Closure Bottlenecks (n = 699 Audits)

CSAT of these contact reasons is 52.1%. Not those tickets. Audits and surveys do not share a ticket ID.

Why it did not close	Audits	Share	Of those, followed process
Policy blocked refund / close	267	38%	215
No tool — must escalate	158	23%	116
Other / unclear	103	15%	77
No analysis ("No aplica")	88	13%	63
Fraud named in the text	25	4%	19
Courier / store / restaurant	18	3%	12
Model: no low CSAT to analyse	14	2%	8
Delay / ETA (undercounted)	17	2%	12
Agent missed the process	9	1%	5

• **Policy & Tooling Dominance (61% Combined):** *Policy-blocked refunds/closures (38% / 267 cases)* and *Missing tooling forcing escalations (23% / 158 cases)* account for over 60% of all unclosed interactions.

• **High Process Compliance (75.4%):** In 527 of the 699 unclosed cases, agents strictly adhered to operational protocols. The interaction remained unresolved due to hard system boundaries, not agent inaction.

The main blockers are policy and tools, not agent greetings.

• **Policy Blocker Chain:** *Why dissatisfied?* Issue unresolved. > *Why unresolved?* Agent stated refund was impossible. > **Root Cause:** Restrictive corporate policy blocks compensation.

• **Tooling Blocker Chain:** *Why dissatisfied?* Order delayed and customer hungry. > *Why unresolved?* Order delayed over 2 hours without update. > **Root Cause:** Agent lacks ETA visibility or live dispatch control tools.

Resolution Mechanics (n = 1,415 Audits)

CSAT of these contact reasons is 70.9%. Not those tickets. Audits and surveys do not share a ticket ID.

What closing was	Audits	Share
Confirmed a refund or compensation	662	47%
Explained / confirmed the process	124	9%
Used a tool or filed a report	156	11%
Other / unclear	251	18%
No analysis ("No aplica")	145	10%
Cancellation processed	43	3%
Model: no low CSAT to analyse	34	2%

• **Monetary Remediation Dominance (47%):** Direct financial resolution (*Refund or compensation*) drives 47% of all successful closures (662 cases), identifying financial empowerment as the single most effective resolution tool.

• **Informational & Tool Enablers (20% Combined):** *Tool usage/report filing (11% / 156 cases)* and *Clear process explanations (9% / 124 cases)* represent the secondary pillars of successful case closure.

When cases are closed, the resolution usually involves a refund, an explanation, or a tool

Resolution Success Chain: *Why satisfied?* Agent confirmed immediate order refund. > *Why confirmed?* Agent reviewed order data and confirmed delay threshold. > **Root Cause:** Agent had direct system authority and tool access to grant compensation on first contact.

Why the customer comes back even when QA says the interaction was good

Standard QA measures process execution (94.14), while CSAT measures issue resolution (79.95%), resulting in a complete

Core Strategic Takeaway:

What we will do: report close-rate by contact reason. Score correct info on Chat.

What changes

- Report auditor closure next to QA, by channel and contact reason (not FCR). Phone closes 9 of 10 assessed (87.9%); Chat 6 of 10 (63.0%). Green if 70%+ closure and 85%+ CSAT.
- Assign each improvement to the relevant contact reason. The Dissatisfaction_Owner field only appears in about 4% of audits, so it should not be used as the primary ownership map.
- This month: correct Pareto defects we already score (Phone time management and complete information; Chat greeting, attitude, availability). That is operational, not a form change.
- Separately, add Chat correct-information as a critical so the scorecard stops inflating (Chat QA would read 80.14). That does not lift CSAT. Track CSAT on targeted contact reasons.

How we will know it worked

Measure	Today	Target	Horizon
QA vs CSAT (R^2)	R² 0.02	R ² 0.25 or above	2 quarters
Close-rate vs CSAT (R^2)	R² 0.64	Keep 0.50 or above	ongoing
CSAT	79.95%	85.0%	2 quarters
Recontact (human: Phone + Chat)	15.56%	10.0%	1 quarter
Auditor close rate (Phone / Chat)	87.9% / 63.0%	90% / 75%	1 quarter

06

Action plans

What must change. Who owns it. When it lands.

Action plan by Business Type

Delivery is the only line of business in the data. Plans are cut by Business Type.

Business Type	Evidence	What must change	Who	When	Problem severity
Food	CSAT 80.74% on 46,071 surveys; order status repeats at 19.34%. Chat closes 6 of 10 assessed: this is that gap, not a staffing gap.	Add a live courier ETA to the agent console so customers receive a verifiable status.	CX Ops + Product	30 Jun	Critical
Full Service	CSAT 79.67%, the lowest of the volume lines; undelivered orders audit at 68.2 on 49 audits	Give Phone agents limited same-call refund authority for eligible undelivered orders. Phone already closes 9 of 10; this attacks the remaining 1 and the Chat refund pile.	CX Ops + Finance	15 Jul	Critical
Market Place	CSAT 80.34% on 3,489 surveys; worst Phone QA reason (47.5) but on only 4 audits	Define a clear merchant-escalation SLA and script for “completed but not received.” Low confidence: run 20+ audits on this reason before committing merchant-side resources	Merchant Ops	15 Jul	High
All Business Types	Refund or compensation not received is 18.8% of negative verbatims	Send an automatic notification whenever refund status changes	Product + CX Ops	31 Jul	High
Data quality	'Other' Business Type holds 558 surveys at 26.5% CSAT	Fix the CR-to-Business-Type mapping so detractors are correctly classified	CX Analytics	20 Jun	Moderate

Severity rates how large the gap is. None of these actions has started yet.

Market Place. That case rests on a contact reason with only 4 audits, the same low-volume reason flagged as unreliable in the Phone QA section. Validate with more audits before committing resources.

Action plan by channel, people and governance

Owner, deadline and the severity of the problem behind each action

Scope	What must change	Why now	Who	When	Problem severity
Phone	Increase Phone QA coverage to at least 30%	Phone is 14.4% of audits and the only channel below goal	QA Lead	13 Jun	Critical
Phone	Coach Time Management: system-check script at start; escalate if no data in 2 minutes	64.3% of Phone defects, 133 fails	Supervisors	27 Jun	High
People	Run weekly coaching for the 42 QA-Q4 agents, starting with the five teams with the highest concentration	26 agents below the QA goal; Supervisor 13 alone carries three	Supervisors + QA Lead	20 Jun	High
Live Chat	Add a Chat critical attribute for correct information, aligned with Phone	372 chats did not follow process; 297 still score 100. Current Chat QA: 96.01. Adjusted QA under proposed scoring: 80.14	QA Lead	30 Jun	Critical
Live Chat	Do not add Chat headcount. Chat closes 6 of 10 assessed (63.0%); 499 of 658 unresolved followed process. Order status and refunds will not close with more agents.	Chat abandon 15.6% vs Phone 4.8%. Live Chat generates 67.2% of every repeat contact.	CX Ops	15 Jul	Critical
QA governance	Report auditor closure weekly by channel (Phone 87.9%, Chat 63.0%) and assign an owner to every unclosed case. Not FCR.	499 Chat and 28 Phone unresolved cases followed process. The field is already on the form (QA 96.87).	QA Lead + CX Head	31 Jul	Critical
QA governance	Report QA and recontact weekly by channel, including Phone+Chat vs the official global rate	Blended figures hid a 13-point channel gap and a 10-point recontact gap	CX Analytics	13 Jun	Moderate

Tagged actions — one action can serve two KPIs. Unique list is on the matrix.

QA	94.14	8 actions	QA Lead
CSAT	79.95%	6 actions	CX Ops
Recontact	5.83%	4 actions	CX Ops

Fix what we measure vs what the customer gets

Phone closes 9 of 10 assessed; Chat 6 of 10. Do not staff Chat for that gap: most unresolved chats followed process. ETA and refunds change the outcome. Pareto coaching and the Chat critical change the scorecard. Do not mix those.

What this month is telling us

Our operation looks healthy when we measure agent process compliance (QA 94.14), but the customer outcome tells a different story. Blended CSAT is 79.95% against 85% (Phone 86.3%, Chat 77.6%), and human-channel recontact is 15.56%, nearly three times the 5.44% goal. The largest gaps sit in contact reasons where agents cannot close the case: policy, tooling, or no visibility. The priority is not simply more coaching. Measure resolution. Phone closes 9 of 10 assessed contacts; Chat 6 of 10. Correct the scored defects this month. Fix the QA scoring gaps. Give agents a way to close the highest-volume failure reasons.

Three things to do

Measure resolution

Put % closed next to QA, by channel and contact reason. Phone closes 9 of 10 assessed (87.9%); Chat 6 of 10 (63.0%). Not FCR. Closure is strongly associated with CSAT. Close-rate vs CSAT: R^2 0.64.

Fix scored defects, then the form

This month: Phone time management and complete information; Chat greeting, attitude, availability. Then close the Chat scoring gap (current 96.01 vs 80.14 if process-fails scored 0). The second number is measurement, not CSAT.

Let agents close the case

Policy, tools, and visibility on the highest-volume failure reasons. Phone already closes 9 of 10 assessed; Chat leaves 4 of 10 open, mostly after following process. The priority is that constraint, not Chat coaching volume.
